[Justification for Real World Testing Approach](#)

Helios is a web-based Practice management Software (PPMS, EHR) system for use in an ambulatory care setting. The goal is to demonstrate interoperability through data transfer with respect to clinical data and documents. Methodology and functionality used is consistent with the certified criteria established and certified to the ONC-ACB on March 31, 2020. Interoperability is achieved through C-CDA format utilizing direct messaging processes in a patient-by-patient basis. Additionally other parts of interoperability are achieved through patient access. Real world testing will be performed on specific scenarios included in this test plan, as demonstrated by the use of this application with outcomes logged, reported and analyzed.

Justification for using an analytics approach is based on the best way to demonstrate the interoperability and functionality of the system.

## Standards Updates (Including Standards Version Advancement Process (SVAP) and United States Core Data for Interoperability (USCDI))

It is the intention to meet the updated versions once finalized.

Standards Updates (SVAP and USCDI)	
Standard (and version)	N/A
Date of ONC-ACB notification	N/A
Date of customer notification	N/A
USCDI – update criteria	N/A

## Measures and Approach

All measures conducted in an ambulatory clinical setting specifically our typical clinicians range from Neurosurgical, Family Practice, Integrative Medicine and Naturopathic Clinicians.

Associated Criteria	Approach	Expected Outcomes
170.315 (b)(1) – Transition of Care	Clinical information sent and received using established appropriate protocols	Review using the data analytics approach indicating the information sent and received should reach target with a > 1% error rate
170.315 (b)(2) – Clinical Information Reconciliation and Incorporation	Clinical information reconciled and incorporated within the patient account	Review using the data analytics approach indicating the information was incorporated within the targeted data set with a > 1% error rate
170.315 (c)(1) – Clinical Quality Measures - Record and Export	CQM information to be recorded and exported using appropriate functionality and protocols.	Review using the data analytics approach indicating the data recorded and exported with a > 1% error rate

170.315 (c)(2) – Clinical Quality Measures - Import and Calculate	CQM information to be imported and calculated in the appropriate section.	Review using the data analytics approach indicating the data was imported and calculated with a > 1% error rate
170.315 (c)(3) – Clinical Quality Measures – Report	CQM data to be reported using appropriate tools or functionality	Review using the data analytics approach indicating the data reported with a > 1% error rate
170.315 (e)(1) – View, Download, and Transmit to 3rd Party	Data to be displayed/viewed, exported and available for download and transmitted to a 3 <sup>rd</sup> party using appropriate protocol and or tools.	Review using the data analytics approach indicating the data processed with a > 1% error rate
170.315 (f)(1) – Transmission to Immunization Registries	Appropriate data set to be transmitted to approved immunization registries	Review using the data analytics approach indicating the data transmitted with a > 1% error rate
170.315 (f)(5) – Transmission to Public Health Agencies - Electronic Case Reporting	Appropriate data set to be transmitted to approved public health agencies in electronic format	Review using the data analytics approach indicating the information data transmitted with a > 1% error rate
170.315 (g)(7) – Application Access - Patient Selection	Grant patient access to appropriate data set in the system	Review using the observational testing approach indicating the patients gain access with a > 1% error rate
170.315 (g)(8) – Application Access - Data Category Request	Grant access to specific data sets in the system	Review using the observational testing approach indicating the patients gain access to specific data categories with a > 1% error rate
170.315 (g)(9) – Application Access - All Data Request	Grant access without specific data set criteria allowing for an all data request	Review using the observational testing approach indicating the patients gain access to all data with a > 1% error rate

170.315 (h)(1) – Direct Project	Create a file using direct messaging functionality to send information to another entity.	Review using the data analytics approach to assure the creation and that the file was sent with respective data with a > 1% error rate
---------------------------------	---	--

Based on our selected criteria. The analysis will be performed by taking note of the number of data packets sent vs. the number of data packets received if applicable. Additionally where there is quantitative data available, the number of tangible data elements such as appointments, encounters or patients sent vs. received will be the determining factor of success or failure of the test.

For criteria based on patient portal and patient access, the analysis will be conducted based on the number of patients granted access vs. the number who are able to access the system.

As an analysis for expected outcomes. Administrators will review the total number of data sets sent, received, transmitted or reported depending on the measure. Only expected measures with controllable outcomes will be reviewed and reported. Patient access is a measure where granting access and not gaining access will be the determining factor. Other factors could inhibit gaining access to the EHR outside the boundaries of the system. (i.e., Internet access, lost passwords etc.)

Other analysis will be based on total number of information data set points attributed to the applicable measure with starting values prior to import, reporting, export or transmission and an ending value of data set points. Error rates should be reviewed to determine processed data between entities or expected outcomes in reporting or access controls.

## Key Milestones

Milestone	Date/Timeframe
Real World Test Plan Submission	November 12, 2021
Submit call to action for prospected providers for testing	January - 2022
Start phased approach implementing testing and analysis	April – June 2022
Review and analyze data based on testing results	July - September 2022
Report findings of Real World Testing to ACB	October 1, 2022
Submit Real World Testing Plan Module 2	November - 2022

All milestones, testing and analysis will be conducted within an ambulatory/ clinic care setting. Helios is only provided to these types of clinicians and illustrates our only customer base. All certified measures are also only provided to these types of providers in this type of care setting.

## Attestation

This Real World Testing plan is complete with all required elements, including measures that address all certification criteria and care settings. All information in this plan is up to date and fully addresses the health IT developer's Real World Testing requirements.
